Package: diyar (via r-universe)

October 12, 2024

Type Package

Title Record Linkage and Epidemiological Case Definitions in 'R'

Date 2023-11-12

Version 0.5.1.9001

URL https://olisansonwu.github.io/diyar/index.html

BugReports https://github.com/OlisaNsonwu/diyar/issues

Author Olisaeloka Nsonwu

Maintainer Olisaeloka Nsonwu <olisa.nsonwu@gmail.com>

Description An R package for iterative and batched record linkage, and applying epidemiological case definitions. 'diyar' can be used for deterministic and probabilistic record linkage, or multistage record linkage combining both approaches. It features the implementation of nested match criteria, and mechanisms to address missing data and conflicting matches during stepwise record linkage. Case definitions are implemented by assigning records to groups based on match criteria such as person or place, and overlapping time or duration of events e.g. sample collection dates or periods of hospital stays. Matching records are removed or further analyses as required.

attr_eval

Description

Recursive evaluation of a function (func) on each attribute (vector) in a sub_criteria.

Usage

attr_eval(x, func = length, simplify = TRUE)

Arguments

Х	[sub_criteria]
func	[function]
simplify	If TRUE (default), coerce to a vector.

Value

vector; list

Examples

```
x <- sub_criteria(rep(1, 5), rep(5 * 10, 5))
attr_eval(x)
attr_eval(x, func = max)
attr_eval(x, func = max, simplify = FALSE)
attr_eval(sub_criteria(x, x), func = max, simplify = FALSE)</pre>
```

bys_funcs

Vectorised approach to group operations.

Description

Vectorised approach to group operations.

Usage

```
bys_count(by)
```

bys_rank(..., by = NULL, from_last = FALSE)
bys_position(val, by = NULL, from_last = FALSE, ordered = TRUE)
bys_val(..., val, by = NULL, from_last = FALSE)

bys_nval(..., val, by = NULL, from_last = FALSE, n = 1, nmax = FALSE) bys_min(val, by = NULL, na.rm = TRUE) bys_max(val, by = NULL, na.rm = TRUE) bys_sum(val, by = NULL, na.rm = TRUE) bys_prod(val, by = NULL, na.rm = TRUE) bys_cummax(val, by = NULL, na.rm = TRUE) bys_cummax(val, by = NULL, na.rm = TRUE) bys_cumsum(val, by = NULL, na.rm = TRUE) bys_cumprod(val, by = NULL, na.rm = TRUE) bys_lag(val, by = NULL, n = 1)

Arguments

by	[atomic]. Groups.
	[atomic]. Sort levels
from_last	[logical] Sort order - TRUE (descending) or FALSE (ascending).
val	[atomic]. Value
ordered	If TRUE, values are sequential.
n	[integer] Position.
nmax	[logical] If TRUE, use length([by]) when n is greater than the number of records in a group.
na.rm	If TRUE, remove NA values

Value

[atomic]

```
x <- data.frame(
 group = c(2, 2, 1, 2, 1, 1, 1, 2, 1, 1),
 value = c(13, 14, 20, 9, 2, 1, 8, 18, 3, 17))
bys_count(x$group)
bys_position(x$value, by = x$group, from_last = TRUE)
bys_rank(by = x$group, val = x$value, from_last = TRUE)
bys_val(x$value, by = x$group, val = x$value, from_last = TRUE)
```

combi

```
bys_nval(x$value, by = x$group, val = x$value, from_last = TRUE, n = 2)
bys_min(by = x$group, val = x$value)
bys_max(by = x$group, val = x$value)
bys_sum(by = x$group, val = x$value)
bys_prod(by = x$group, val = x$value)
bys_cummin(by = x$group, val = x$value)
bys_cummax(by = x$group, val = x$value)
bys_cumsum(by = x$group, val = x$value)
bys_cumprod(by = x$group, val = x$value)
bys_lag(by = x$group, val = x$value)
bys_lag(by = x$group, val = x$value)
```

combi	Vector combinations	

Description

Numeric codes for unique combination of vectors.

Usage

combi(...)

Arguments

... [atomic]

Value

numeric

```
x <- c("A", "B", "A", "C", "B", "B")
y <- c("X", "X", "Z", "Z", "X", "Z")
combi(x, y)
# The code above is equivalent to but quicker than the one below.
z <- paste@(y, "-", x)
z <- match(z, z)
z
```

custom_sort

Description

Returns a sort order after sorting by a vector within another vector.

Usage

```
custom_sort(..., decreasing = FALSE, unique = FALSE)
```

Arguments

•••	Sequence of atomic vectors. Passed to order.
decreasing	Sort order. Passed to order.
unique	If FALSE (default), ties get the same rank. If TRUE, ties are broken.

Value

numeric sort order.

Examples

```
a <- c(1, 1, 1, 2, 2)
b <- c(2, 3, 2, 1, 1)
custom_sort(a, b)
custom_sort(b, a)
custom_sort(b, a, unique = TRUE)
```

delink

Unlink group identifiers

Description

Unlink records from an episode (epid), record group (pid) or pane (pane) object.

delink

Usage

```
delink(x, lgk, ...)
## S3 method for class 'epid'
delink(x, lgk, ...)
## S3 method for class 'pane'
delink(x, lgk, ...)
## S3 method for class 'pid'
delink(x, lgk, ...)
```

Arguments

х	[epid pid pane]
lgk	[logical]. Subset of records to unlink.
	Other arguments.

Value

epid; pid; pane

d_report

Description

d_report

Usage

```
## S3 method for class 'd_report'
plot(
    x,
    ...,
    metric = c("cumulative_duration", "duration", "max_memory", "records_checked",
        "records_skipped", "records_assigned")
)
## S3 method for class 'd_report'
as.list(x, ...)
## S3 method for class 'd_report'
as.data.frame(x, ...)
```

Arguments

Х	[d_report].
	Arguments passed to other methods
metric	Report information

encode

Labelling in diyar

Description

Encode and decode character and numeric values.

Usage

```
encode(x, ...)
decode(x, ...)
## Default S3 method:
encode(x, ...)
```

encode

```
## S3 method for class 'd_label'
encode(x, ...)
## Default S3 method:
decode(x, ...)
## S3 method for class 'd_label'
decode(x, ...)
## S3 method for class 'd_label'
rep(x, ...)
## S3 method for class 'd_label'
x[i, ..., drop = TRUE]
## S3 method for class 'd_label'
x[[i, ..., drop = TRUE]]
```

Arguments

x	[d_label atomic]
	Other arguments.
i	i
drop	drop

Details

To minimise memory usage, most components of pid, epid and pane are integer objects with labels. encode() and decode() translates these codes and labels as required.

Value

d_label; atomic

```
cds <- encode(rep(LETTERS[1:5], 3))
cds
nms <- decode(cds)
nms</pre>
```

epid-class

Description

S4 objects storing the result of episodes.

Usage

```
is.epid(x)
as.epid(x, ...)
## S3 method for class 'epid'
format(x, ...)
## S3 method for class 'epid'
unique(x, ...)
## S3 method for class 'epid'
summary(object, ...)
## S3 method for class 'epid_summary'
print(x, ...)
## S3 method for class 'epid'
as.data.frame(x, ..., decode = TRUE)
## S3 method for class 'epid'
as.list(x, ..., decode = TRUE)
## S4 method for signature 'epid'
show(object)
## S4 method for signature 'epid'
rep(x, ...)
## S4 method for signature 'epid'
x[i, j, ..., drop = TRUE]
## S4 method for signature 'epid'
x[[i, j, ..., exact = TRUE]]
## S4 method for signature 'epid'
c(x, ...)
```

epid-class

Arguments

х	Х
•••	
object	object
decode	If TRUE, data is decoded
i	i
j	j
drop	drop
exact	exact

Slots

sn Unique record identifier.

.Data Unique episode identifier.

wind_id Unique reference ID for each match.

wind_nm Type of window i.e. "Case" or "Recurrence".

case_nm Record type in regards to case assignment.

dist_wind_index Unit difference between each record and its window's reference record.

dist_epid_index Unit difference between each record and its episode's reference record.

epid_dataset Data sources in each episode.

epid_interval The start and end dates of each episode. A number_line object.

epid_length The duration or length of (epid_interval).

epid_total The number of records in each episode.

iteration The iteration when a record was matched to it's group (.Data).

options Some options passed to the instance of episodes.

```
# A test for `epid` objects
ep <- episodes(date = 1)
is.epid(ep); is.epid(2)
ep <- episodes(date = 1)
is.epid(ep); is.epid(2)</pre>
```

episodes

Description

Dated events (records) within a certain duration of an index event are assigned to a unique group. Each group has unique ID and are described as "episodes". "episodes" can be "fixed" or "rolling" ("recurring"). Each episodes has a "Case" and/or "Recurrent" record while all other records within the group are either "Duplicates" of the "Case" or "Recurrent" event.

Usage

```
episodes(
  date,
  case_length = Inf,
  episode_type = "fixed",
  recurrence_length = case_length,
  episode_unit = "days",
  strata = NULL,
  sn = NULL,
  episodes_max = Inf,
  rolls_max = Inf,
  case_overlap_methods = 8,
  recurrence_overlap_methods = case_overlap_methods,
  skip_if_b4_lengths = FALSE,
  data_source = NULL,
  data_links = "ANY",
  custom_sort = NULL,
  skip_order = Inf,
  reference_event = "last_record",
  case_for_recurrence = FALSE,
  from_last = FALSE,
  group_stats = c("case_nm", "wind", "epid_interval"),
  display = "none",
  case_sub_criteria = NULL,
  recurrence_sub_criteria = case_sub_criteria,
  case_length_total = 1,
  recurrence_length_total = case_length_total,
  skip_unique_strata = TRUE,
  splits_by_strata = 1,
  batched = "semi"
)
links_wf_episodes(
  date,
  case_length = Inf,
  episode_type = "fixed",
```

episodes

```
strata = NULL,
 sn = NULL,
 display = "none"
)
episodes_af_shift(
 date,
 case_length = Inf,
 sn = NULL,
 strata = NULL,
 group_stats = FALSE,
 episode_type = "fixed",
 data_source = NULL,
 episode_unit = "days",
 data_links = "ANY",
 display = "none"
)
```

Arguments

date	[date datetime integer number_line]. Record date or period.
case_length	[integer number_line]. Duration from an index event distinguishing one "Case" from another.
episode_type	[character]. Options are "fixed" (default) or "rolling". See Details.
recurrence_leng	th
	[integer number_line]. Duration from an index event distinguishing a "Recurrent" event from its "Case" or prior "Recurrent" event.
episode_unit	[character]. Unit of time for case_length and recurrence_length. Op- tions are "seconds", "minutes", "hours", "days" (default), "weeks", "months" or "years". See diyar::episode_unit.
strata	[atomic]. Subsets of the dataset. Episodes are created separately by each strata.
sn	[integer]. Unique record ID.
episodes_max	[integer]. Maximum number of episodes permitted within each strata.
rolls_max	[integer]. Maximum number of times an index event can recur. Only used if episode_type is "rolling".
case_overlap_me	thods
	[character integer]. Specific ways a period (record) most overlap with a "Case" event. See (overlaps).
recurrence_over	lap_methods
	[character integer]. Specific ways a period (record) most overlap with a "Recurrent" event. See (overlaps).
skip_if_b4_leng	ths
	[logical]. If TRUE (default), events before a lagged case_length or recurrence_length are skipped.

data_source	[character]. Source ID for each record. If provided, a list of all sources in each episode is returned. See epid_dataset slot.
data_links	[list character]. data_source required in each epid. An episode without records from these data_sources will be unlinked. See Details.
custom_sort	[atomic]. Preferential order for selecting index events. See custom_sort.
skip_order	[integer]. End episode tracking in a strata when the an index event's custom_sort order is greater than the supplied skip_order.
reference_event	
	<pre>[character]. Specifies which of the records are used as index events. Options are "last_record" (default), "last_event", "first_record" or "first_event".</pre>
case_for_recurr	rence
	[logical]. If TRUE, a case_length is applied to both "Case" and "Recurrent" events. If FALSE (default), a case_length is applied to only "Case" events.
from_last	[logical]. Track episodes beginning from the earliest to the most recent record (FALSE) or vice versa (TRUE).
group_stats	[character]. A selection of group metrics to return for each episode. Most are added to slots of the epid object. Options are NULL or any combination of "case_nm", "wind" and "epid_interval".
display	[character]. Display progress update and/or generate a linkage report for the analysis. Options are; "none" (default), "progress", "stats", "none_with_report", "progress_with_report" or "stats_with_report".
case_sub_criter	ia
	[sub_criteria]. Additional nested match criteria for events in a case_length.
recurrence_sub_	
	[sub_criteria]. Additional nested match criteria for events in a recurrence_length.
case_length_tot	
	[integer number_line]. Minimum number of matched case_lengths re- quired for an episode.
recurrence_leng	
	[integer number_line]. Minimum number of matched recurrence_lengths required for an episode.
<pre>skip_unique_str</pre>	rata
	[logical]. If TRUE, a strata with a single event is skipped.
<pre>splits_by_strat</pre>	
	[integer]. Split analysis into n parts. This typically lowers max memory usage but increases run time.
batched	[character]. Create and compare records in batches. Options are "yes", "no", and "semi". typically, the ("semi") option will have a higher max memory and shorter run-time while ("no") will have a lower max memory but longer run-time

Details

episodes() links dated records (events) that are within a set duration of each other in iterations. Every record is linked to a unique group (episode; epid object). These episodes represent occurrences of interest as specified by function's arguments and defined by a case definition.

episodes

Two main type of episodes are possible;

- "fixed" An episode where all events are within a fixed duration of an index event.
- "rolling" An episode where all events are within a recurring duration of an index event.

Every record in each episode is categorised as one of the following;

- "Case" Index event of the episode (without a nested match criteria).
- "Case_CR" Index event of the episode (with a nested match criteria).
- "Duplicate_C" Duplicate of the index event.
- "Recurrent" Recurrence of the index event (without a nested match criteria).
- "Recurrent_CR" Recurrence of the index event (with a nested match criteria).
- "Duplicate_R" Duplicate of the recurrent event.
- "Skipped" Skipped records.

If data_links is supplied, every element of the list must be named "1" (links) or "g" (groups). Unnamed elements are assumed to be "1".

- If named "1", groups without records from every listed data_source will be unlinked.
- If named "g", groups without records from any listed data_source will be unlinked.

All records with a missing (NA) strata or date are skipped.

Wrapper functions or alternative implementations of episodes() for specific use cases or benefits:

- episodes_wf_repeats() Identical records are excluded from the main analysis.
- episodes_af_shift() A mostly vectorised approach.
- links_wf_episodes() The same functionality achieved with links.

See vignette("episodes") for further details.

Value

epid; list

           strata = NULL,
           case_length = index_window(dfr$admin_period),
           case_overlap_methods = "inbetween")
dfr
as.data.frame(dfr$ep)
```

episodes_wf_repeats Link events to chronological episodes.

Description

episodes_wf_repeats is a wrapper function of episodes. It's designed to be more efficient with larger datasets. Duplicate records which do not affect the case definition are excluded prior to episode tracking. The resulting episode identifiers are then recycled for the duplicate records.

Usage

```
episodes_wf_repeats(..., duplicates_recovered = "ANY")
```

Arguments

	Arguments passed to episodes.	
duplicates_recovered		
	[character]. Determines which duplicate records are recycled. Options are "ANY" (default), "without_sub_criteria", "with_sub_criteria" or "ALL". See Details.	
reframe	[logical]. Determines if the duplicate records in a sub_criteria are re-framed (TRUE) or excluded (FALSE).	

16

links

Details

episodes_wf_repeats() reduces or re-frames a dataset to the minimum datasets required to implement a case definition. This leads to the same outcome but with the benefit of a shorter processing time.

The duplicates_recovered argument determines which identifiers are recycled. Selecting the "with_sub_criteria" option will force only identifiers created resulting from a matched sub_criteria ("Case_CR" and "Recurrent_CR") are recycled. However, if "without_sub_criteria" is selected then only identifiers created that do not result from a matched sub_criteria ("Case" and "Recurrent") are recycled Excluded duplicates of "Duplicate_C" and "Duplicate_R" are always recycled.

The reframe argument will either reframe or subset a sub_criteria. Both will require slightly different functions for match_funcs or equal_funcs.

Value

epid; list

See Also

episodes; sub_criteria

Examples

```
# With 2,000 duplicate records of 20 events,
# `episodes_wf_repeats()` will take less time than `episodes()`
dates <- seq(from = as.Date("2019-04-01"), to = as.Date("2019-04-20"), by = 1)
dates <- rep(dates, 2000)
system.time(
  ep1 <- episodes(dates, 1)
)
system.time(
  ep2 <- episodes_wf_repeats(dates, 1)
)
# Both leads to the same outcome.
all(ep1 == ep2)
```

links

Multistage record linkage

Description

Assign records to unique groups based on an ordered set of match criteria.

Usage

```
links(
 criteria,
  sub_criteria = NULL,
 sn = NULL,
 strata = NULL,
 data_source = NULL,
 data_links = "ANY",
 display = "none",
 group_stats = FALSE,
 expand = TRUE,
 shrink = FALSE,
 recursive = "none",
 check_duplicates = FALSE,
  tie_sort = NULL,
 batched = "yes",
  repeats_allowed = FALSE,
 permutations_allowed = FALSE,
  ignore_same_source = FALSE
)
```

Arguments

[list atomic]. Ordered list of attributes to be compared. Each element of the list is a stage in the linkage process. See Details.
[list sub_criteria]. Nested match criteria. This must be paired to a stage of the linkage process (criteria). See sub_criteria
[integer]. Unique record ID.
[atomic]. Subsets of the dataset. Record-groups are created separately for each strata. See Details.
[character]. Source ID for each record. If provided, a list of all sources in each record-group is returned. See pid_dataset slot.
[list character]. data_source required in each pid. A record-group with- out records from these data_sources will be unlinked. See Details.
[character]. Display progress update and/or generate a linkage report for the analysis. Options are; "none" (default), "progress", "stats", "none_with_report", "progress_with_report" or "stats_with_report".
[logical]. If TRUE (default), return group specific information like record counts for each pid.
[logical]. If TRUE, a record-group gains new records if a match is found at the next stage of the linkage process. <i>Not interchangeable with</i> shrink.
[logical]. If TRUE, a record-group loses existing records if no match is found at the next stage of the linkage process. <i>Not interchangeable with</i> expand.
[logical]. If TRUE, within each iteration of the process, a match can spawn new matches. Ignored when batched is "no".

18

	[logical]. If TRUE, within each iteration of the process, duplicates values of an attributes are not checked. The outcome of the logical test on the first instance of the value will be recycled for the duplicate values. Ignored when batched is "no".
tie_sort	[atomic]. Preferential order for breaking match ties within an iteration of record linkage.
batched	[character] Determines if record-pairs are created and compared in batches. Options are "yes", "no" or "semi".
repeats_allo	wed
	[logical] If TRUE, pairs made up of repeat records are not created and com- pared. Only used when batched is "no".
permutations.	_allowed
	[logical] If TRUE, permutations of record-pairs are created and compared. Only used when batched is "no".
ignore_same_	source
	[logical] If TRUE, only records-pairs from a different data_source are created and compared.

The priority of matches decreases with each subsequent stage of the linkage process. Therefore, the

attributes in criteria should be in an order of decreasing relevance.

Records with missing data (NA) for each criteria are skipped at the respective stage, while records with missing data strata are skipped from every stage.

If a record is skipped from a stage, another attempt will be made to match the record at the next stage. If a record is still unmatched by the last stage, it is assigned a unique group ID.

A sub_criteria adds nested match criteria to each stage of the linkage process. If used, only records with a matching criteria and sub_criteria are linked.

In links, each sub_criteria must be linked to a criteria. This is done by adding each sub_criteria to a named element of a list - "cr" concatenated with the corresponding stage's number. For example, 3 sub_criteria linked to criteria 1, 5 and 13 will be;

 $list(cr1 = sub_criteria(...), cr5 = sub_criteria(...), cr13 = sub_criteria(...))$

Any unlinked sub_criteria will be ignored.

Every element in data_links must be named "1" (links) or "g" (groups). Unnamed elements of data_links will be assumed to be "1".

- If named "1", groups without records from every listed data_source will be unlinked.
- If named "g", groups without records from any listed data_source will be unlinked.

See vignette("links") for more information.

  score_threshold = 1,
  repeats_allowed = FALSE,
  permutations_allowed = FALSE,
  data_source = NULL,
  ignore_same_source = TRUE,
  display = "none"
)
links_wf_probabilistic(
  attribute,
  blocking_attribute = NULL,
  cmp_func = diyar::exact_match,
  attr_threshold = 1,
  probabilistic = TRUE,
 m_{probability} = 0.95,
  u_probability = NULL,
  score_threshold = 1,
  id_1 = NULL,
  id_2 = NULL,
  return_weights = FALSE,
)
```

prob_score_range(attribute, m_probability = 0.95, u_probability = NULL)

Arguments

attribute	[atomic list data.frame matrix d_attribute]. Attributes to compare.
blocking_attrib	ute
	[atomic]. Passed to criteria in links.
cmp_func	[list function]. String comparators for each attribute. See Details.
attr_threshold	<pre>[list numeric number_line]. Weight-thresholds for each cmp_func. See Details.</pre>
probabilistic	[logical]. If TRUE, scores are assigned base on Fellegi-Sunter model for probabilistic record linkage. See Details.
m_probability	[list numeric]. The probability that a matching records are the same entity.
u_probability	[list numeric]. The probability that a matching records are not the same entity.
score_threshold	
	[numeric number_line]. Score-threshold for linked records. See Details.
repeats_allowed	
	[logical] Passed to repeats_allowed in links.
permutations_al	
	[logical] Passed to permutations_allowed in links.
data_source	[character]. Passed to data_source in links.
ignore_same_sou	ince
	[logical] Passed to ignore_same_source in links.
display	[character]. Passed to display in links.
id_1	[list numeric]. Record id or index of one half of a record-pair.
id_2	[list numeric]. Record id or index of one half of a record-pair.
return_weights	If TRUE, returns the match-weights and score-thresholds for record pairs.
	Arguments passed to links

Details

links_wf_probabilistic() - A wrapper function of links with a with a specific sub_criteria and to achieve to achieve probabilistic record linkage It excludes functionalities for the nested and multi-stage linkage. links_wf_probabilistic() requires a score_threshold in advance. To help with this, prob_score_range() can be used to return the range of scores attainable for a given set of attribute, m and u-probabilities. Additionally, id_1 and id_2 can be used to link specific records pairs, aiding the review of potential scores.

links_af_probabilistic() - A simpler version of links. It excludes functionalities for the batched, nested and multi-stage linkage. links_af_probabilistic() requires a score_threshold in advance, however, since it exports the match weights, the score_threshold can be changed after the analysis.

Value

pid; list

link_wf

listr

Grammatical lists.

Description

A convenience function to format atomic vectors as a written list.

make_ids

Usage

listr(x, sep = ", ", conj = " and ", lim = Inf)

Arguments

x	atomic vector.
sep	Separator.
conj	Final separator.
lim	Elements to include in the list. Other elements are abbreviated to " \dots ".

Value

character.

Examples

listr(1:5)
listr(1:5, sep = "; ")
listr(1:5, sep = "; ", conj = " and")
listr(1:5, sep = "; ", conj = " and", lim = 2)

make_ids

Convert an edge list to record identifiers.

Description

Convert an edge list to record identifiers.

Usage

make_ids(x_pos, y_pos, id_length = max(x_pos, y_pos))

Arguments

x_pos	[integer]. Index of first half of a record-pair.
y_pos	[integer]. Index of second half of a record-pair.
id_length	Length of the record identifier.

Details

Record groups from non-recursive links have the lowest record ID (sn) in the set as their group ID.

Value

list

Examples

```
make_ids(x_pos = rep(7, 7), y_pos = 1:7)
make_ids(x_pos = c(1, 6), y_pos = 6:7)
make_ids(x_pos = 1:5, y_pos = c(1, 1, 2, 3, 4))
```

make_pairs

Combinations and permutations of record-sets.

Description

Combinations and permutations of record-sets.

Usage

```
sets(n, r, permutations_allowed = TRUE, repeats_allowed = TRUE)
make_sets(
    x,
    r,
    strata = NULL,
    permutations_allowed = TRUE,
    repeats_allowed = TRUE
)
make_pairs(
    x,
    strata = NULL,
    repeats_allowed = TRUE,
    permutations_allowed = FALSE
)
```

make_pairs_wf_source(..., data_source = NULL)

Arguments

n	[integer]. Size of Vector.
r	[integer]. Number of elements in a set.
permutations_a	llowed
	[logical]. If TRUE, permutations of the same set are included.
repeats_allowed	
	[logical]. If TRUE, repeat values are included in each set.
х	[atomic]. Vector.
strata	Subsets of x. Blocking attribute. Limits the creation of combinations or permutations to those from the same strata.
	Arguments passed to make_pairs.
data_source	[character]. Data source identifier. Limits the creation of combinations or permutations to those from a different data_source

26

make_s4_ids

Details

set() - Create r-set combinations or permutations of n observations.

make_set() - Create r-set combinations or permutations of vector x.

make_pairs() - Create 2-set combinations or permutations of vector x.

make_pairs_wf_source() - Create 2-set combinations or permutations of vector x that are from different sources (data_source).

Value

A list of a vector's elements and corresponding indexes.

See Also

eval_sub_criteria

Examples

```
sets(4, 2)
sets(4, 2, repeats_allowed = FALSE, permutations_allowed = FALSE)
make_sets(month.abb[1:4], 2)
make_sets(month.abb[1:4], 3)
make_pairs(month.abb[1:4])
make_pairs(month.abb[1:4], strata = c(1, 1, 2, 2))
make_pairs_wf_source(month.abb[1:4], data_source = c(1, 1, 2, 2))
```

make_s4_ids

Create epid and pid objects with index of matching records

Description

Create epid and pid objects with index of matching records

Usage

make_episodes(
 x_pos,
 y_pos,
 x_val,
 date,
 case_nm,
 wind_id,
 wind_nm,
 from_last,
 data_source,
 data_links,

```
iteration,
options,
episode_unit
)
make_pids(
  x_pos,
  y_pos,
  x_val,
  link_id,
  pid_cri,
  data_source,
  data_links,
  iteration
)
```

Arguments

x_pos	[integer]. Index of one half of a record pair.
y_pos	[integer]. Index of one half of a record pair.
x_val	[integer]. Value of one half of a record pair.
date	[date datetime integer number_line]. Record date or period.
case_nm	[integer character] Record type in regards to case assignment (sub_criteria[Encoded]).
wind_id	[integer]. Unique reference ID for each match.
wind_nm	[list]. Type of window i.e. "Case" or "Recurrence".
from_last	[logical]. Chronological order of episode tracking i.e. ascending (TRUE) or descending (FALSE).
data_source	[character]. Source ID for each record.
data_links	[list character]. data_source required in each record-group. A record- group without records from these data_sources will be unlinked.
iteration	The iteration when a record was matched to it's group (.Data).
options	[list]. Some options passed to the instance of episodes.
episode_unit	[character]. Time unit for case_length and recurrence_length. See episodes
link_id	[integer]. Unique reference ID for each match.
pid_cri	Match stage of the step-wise linkage.

merge_identifiers Merge group identifiers

Description

Consolidate two group identifiers.

28

merge_identifiers

Usage

```
merge_ids(...)
## Default S3 method:
merge_ids(id1, id2, tie_sort = NULL, expand = TRUE, shrink = FALSE, ...)
## S3 method for class 'pid'
merge_ids(id1, id2, tie_sort = NULL, expand = TRUE, shrink = FALSE, ...)
## S3 method for class 'epid'
merge_ids(id1, id2, tie_sort = NULL, expand = TRUE, shrink = FALSE, ...)
## S3 method for class 'pane'
merge_ids(id1, id2, tie_sort = NULL, expand = TRUE, shrink = FALSE, ...)
```

Arguments

• • •	Other arguments
id1	[integer epid pid pane].
id2	[integer epid pid pane].
tie_sort	[atomic]. Preferential order for breaking tied matches.
expand	[logical]. If TRUE, id1 gains new records if id2 indicates a match. <i>Not inter-changeable with</i> shrink.
shrink	[logical]. If TRUE, id1 loses existing records id2 does not indicate a match. <i>Not interchangeable with</i> expand.

Details

Groups in id1 are expanded or shrunk by groups in id2.

A unique group with only one record is considered a non-matching record.

Note that the expand and shrink features are not interchangeable. The outcome when shrink is TRUE is not the same when expand is FALSE. See Examples.

number_line number_line

Description

A range of numeric values.

Usage

```
number_line(l, r, id = NULL, gid = NULL)
as.number_line(x)
is.number_line(x)
left_point(x)
left_point(x) <- value
right_point(x)
right_point(x) <- value
start_point(x)
start_point(x) <- value
end_point(x)
end_point(x) <- value
number_line_width(x)
reverse_number_line(x, direction = "both")
shift_number_line(x, by = 1)</pre>
```

```
expand_number_line(x, by = 1, point = "both")
invert_number_line(x, point = "both")
number_line_sequence(
    x,
    by = NULL,
    length.out = 1,
    fill = TRUE,
    simplify = FALSE
)
```

Arguments

1	[numeric-based]. Left point of the number_line.
r	[numeric-based]. Right point of the number_line. Must be able to be coerced to a numeric object.
id	[integer]. Unique element identifier. Optional.
gid	[integer]. Unique group identifier. Optional.
x	[number_line]
value	[numeric based]
direction	<pre>[character]. Type of number_line reverse. Options are; "increasing", "decreasing" or "both" (default).</pre>
by	[integer]. Increment or decrement. Passed to seq() in number_line_sequence().
point	[character]. "start", "end", "left" or "right" point.
length.out	[integer]. Number of splits. For example, 1 for two parts or 2 for three parts. Passed to seq().
fill	[logical]. Retain (TRUE) or drop (FALSE) the remainder of an uneven split.
simplify	[logical]. If TRUE, returns a sequence of finite numbers.

Details

A number_line object represents a range of numbers. It is made up of a start and end point as the lower and upper ends of the range respectively. The location of the start point - left or right, determines whether it is an "increasing" or "decreasing" number_line. This is the direction of the number_line.

reverse_number_line() - reverse the direction of a number_line. A reversed number_line has its left and right points swapped. The direction argument specifies which type of number_line will be reversed. number_line with non-finite start or end points (i.e. NA, NaN and Inf) can't be reversed.

shift_number_line() - Shift a number_line towards the positive or negative end of the number line.

expand_number_line() - Increase or decrease the width of a number_line.

invert_number_line() - Change the left or right points from a negative to positive value or vice versa.

number_line_sequence() - Split a number_line into equal parts (length.out) or by a fixed recurring width (by).

Value

number_line

See Also

overlaps; set_operations; episodes; links

Examples

number_line(-100, 100)

```
# Reverse number_line objects
reverse_number_line(number_line(as.Date("2019-04-25"), as.Date("2019-01-01")))
reverse_number_line(number_line(200, -100), "increasing")
reverse_number_line(number_line(200, -100), "decreasing")
```

```
c <- number_line(5, 6)
# Shift number_line objects towards the positive end of the number line</pre>
```

```
shift_number_line(x = c(c, c), by = c(2, 3))
# Shift number_line objects towards the negative end of the number line
shift_number_line(x = c(c, c), by = c(-2, -3))
```

```
# Change the duration, width or length of a number_line object
d <- c(number_line(3, 6), number_line(6, 3))</pre>
```

expand_number_line(d, 2) expand_number_line(d, -2) expand_number_line(d, c(2,-1)) expand_number_line(d, 2, "start") expand_number_line(d, 2, "end")

Invert `number_line` objects

32

number_line-class

```
e <- c(number_line(3, 6), number_line(-3, -6), number_line(-3, 6))
e
invert_number_line(e)
invert_number_line(e, "start")
invert_number_line(e, "end")
# Split number line objects
x <- number_line(Sys.Date() - 5, Sys.Date())
x
number_line_sequence(x, by = 2)
number_line_sequence(x, by = 4)
number_line_sequence(x, by = 4, fill = FALSE)
number_line_sequence(x, length.out = 2)</pre>
```

number_line-class number_line object

Description

S4 objects representing a range of numeric values

Usage

```
## S4 method for signature 'number_line'
show(object)
## S4 method for signature 'number_line'
rep(x, ...)
## S4 method for signature 'number_line'
x[i, j, ..., drop = TRUE]
## S4 method for signature 'number_line'
x[[i, j, ..., exact = TRUE]]
## S4 replacement method for signature 'number_line'
x[i, j, ...] <- value
## S4 replacement method for signature 'number_line'
x[[i, j, ...]] <- value
## S4 method for signature 'number_line'
x$name
## S4 replacement method for signature 'number_line'
x$name <- value
```

```
c(x, ...)
## S3 method for class 'number_line'
unique(x, ...)
## S3 method for class 'number_line'
seq(x, precision = NULL, fill = FALSE, ...)
## S3 method for class 'number_line'
sort(x, decreasing = FALSE, ...)
## S3 method for class 'number_line'
format(x, ...)
## S3 method for class 'number_line'
as.list(x, ...)
## S3 method for class 'number_line'
as.data.frame(x, ...)
```

Arguments

object	object
x	X
i	i
j	j
drop	drop
exact	exact
value	value
name	slot name
precision	Round precision
fill	[logical]. Retain (TRUE) or drop (FALSE) the remainder of an uneven split.
decreasing	If TRUE, sort in descending order.

Slots

start First value in the range.

id Unique element id. Optional.

gid Unique group id. Optional.

.Data Length, duration or width of the range.

34

overlaps

Description

Identify overlapping number_line objects

Usage

```
overlaps(x, y, methods = 8)
overlap(x, y)
none(x, y)
exact(x, y)
across(x, y)
x_across_y(x, y)
y_across_x(x, y)
chain(x, y)
x_chain_y(x, y)
y_chain_x(x, y)
aligns_start(x, y)
x_aligns_start_y(x, y)
y_aligns_start_x(x, y)
aligns_end(x, y)
x_aligns_end_y(x, y)
y_aligns_end_x(x, y)
inbetween(x, y)
x_inbetween_y(x, y)
```

y_inbetween_x(x, y)

overlaps

overlap_method(x, y)

include_overlap_method(methods)

exclude_overlap_method(methods)

overlap_method_codes(methods)

overlap_method_names(methods)

Arguments

х	[number_line]
У	[number_line]
methods	<pre>[charater integer]. Type of overlap. See as.data.frame(diyar::overlap_methods\$options) for options.</pre>

Details

There are 6 mutually exclusive types of overlap;

- exact() identical start_point and end_point points.
- inbetween() Both start_point and end_point of one number_line object are within the start_point and end_point of another.
- across() Only the start_point or end_point of one number_line object is in between the start_point and end_point of another.
- chain() end_point of one number_line object is identical to the start_point of another.
- aligns_start() identical start_point only.
- aligns_end() identical end_point only.

Except exact(), each type of overlap has two variations;

- x_'method'_y() number_line-x starts before number_line-y.
- y_'method'_x() number_line-y starts before number_line-x.

There are two mutually inclusive types of overlap;

- overlap() a convenient option to select "ANY" and "ALL" type of overlap.
- none() a convenient option to select "NO" type of overlap.

Selecting multiple types of overlap;

- overlaps() select specific type(s) of overlap.
- overlap_method() return the type of overlap for a pair of number_line objects.
- overlap_method_codes() return the corresponding overlap method code for a specific type(s) of overlap.
- overlap_method_names() return the corresponding type(s) of overlap for a specific overlap code.

overlaps

- include_overlap_method() return a character(1) value for specified type(s) of overlap.
- exclude_overlap_method() return a character(1) value for all type(s) of overlap except those specified.

Value

logical; character

```

```
x_aligns_end_y(a, g)
y_aligns_end_x(a, g)
```

pane-class pane *object*

Description

S4 objects storing the result of partitions.

Usage

```
is.pane(x)
as.pane(x)
## S3 method for class 'pane'
format(x, ...)

```

pane-class

```
## S4 method for signature 'pane'
c(x, ...)
```

Arguments

х	Х
object	object
decode	If TRUE, data is decoded
i	i
j	j
drop	drop
exact	exact

Slots

sn Unique record identifier.

.Data Unique pane identifier.

case_nm Record type in regards to index assignment.

window_list A list of considered windows for each pane.

dist_pane_index The difference between each event and it's index event.

pane_dataset Data sources in each pane.

pane_interval The start and end dates of each pane. A number_line object.

pane_length The duration or length of (pane_interval).

pane_total The number of records in each pane.

options Some options passed to the instance of partitions.

window_matched A list of matched windows for each pane.

```
# A test for pane objects
pn <- partitions(date = 1, by = 1)
is.pane(pn); is.pane(2)</pre>
```

partitions

Description

Distribute events into groups defined by time or numerical intervals. Each set of linked records are assigned a unique identifier with relevant group-level data.

Usage

```
partitions(
  date,
 window = NULL,
 windows_total = 1,
  separate = FALSE,
  sn = NULL,
  strata = NULL,
  data_links = "ANY",
  custom_sort = NULL,
  group_stats = FALSE,
  data_source = NULL,
  by = NULL,
  length.out = NULL,
  fill = TRUE,
  display = "none",
  precision = 1
)
```

Arguments

date	[date datetime integer number_line]. Event date or period.
window	[integer number_line]. Numeric or time intervals.
windows_total	[integer number_line]. Minimum number of matched windows required for a pane. See details
separate	[logical]. If TRUE, events matched to different windows are not linked.
sn	[integer]. Unique record identifier. Useful for creating familiar pane identi- fiers.
strata	[atomic]. Subsets of the dataset. Panes are created separately for each strata.
data_links	[list character]. A set of data_sources required in each pane. A pane without records from these data_sources will be unlinked. See Details.
custom_sort	[atomic]. Preferred order for selecting "index" events.
group_stats	[logical]. If TRUE (default), the returned pane object will include group spe- cific information like panes start and end dates.
data_source	[character]. Unique data source identifier. Adds the list of datasets in each pane to the pane. Useful when the data is from multiple sources.

partitions

by	[integer]. Width of splits.
length.out	[integer]. Number of splits.
fill	[logical]. Retain (TRUE) or drop (FALSE) the remainder of an uneven split.
display	[character]. Display a status update. Options are; "none" (default), "progress" or "stats".
precision	Round precision

Details

Each assigned group is referred to as a pane A pane consists of events within a specific time or numerical intervals (window).

Each window must cover a separate interval. Overlapping windows are merged before events are distributed into panes. Events that occur over two windows are assigned to the last one listed.

Alternatively, you can create windows by splitting a period into equal parts (length.out), or into a sequence of intervals with fixed widths (by).

By default, the earliest event is taken as the "Index" event of the pane. An alternative can be chosen with custom_sort. Note that this is simply a convenience option because it has no bearing on how groups are assigned.

partitions() will categorise records into 3 types;

- "Index" Index event/record of the pane.
- "Duplicate_I" Duplicate of the "Index" record.
- "Skipped" Records that are not assigned to a pane.

Every element in data_links must be named "1" (links) or "g" (groups). Unnamed elements of data_links will be assumed to be "1".

- If named "1", only groups with records from every listed data_source will be retained.
- If named "g", only groups with records from any listed data_source will be retained.

NA values in strata excludes records from the partitioning process.

See vignette("episodes") for more information.

Value

pane

See Also

pane; number_line_sequence; episodes; links; overlaps; number_line; schema

Examples

```
events <- c(30, 2, 11, 10, 100)
windows <- number_line(c(1, 9, 25), c(3, 12, 35))
events
partitions(date = events, length.out = 3, separate = TRUE)
partitions(date = events, by = 10, separate = TRUE)
partitions(date = events, window = windows, separate = TRUE)
partitions(date = events, window = windows, separate = FALSE)
partitions(date = events, window = windows, separate = FALSE, windows_total = 4)</pre>
```

pid-class pid *objects*

Description

S4 objects storing the result of links.

Usage

```
is.pid(x)
as.pid(x, ...)
## S3 method for class 'pid'
format(x, ...)
## S3 method for class 'pid'
unique(x, ...)
## S3 method for class 'pid'
summary(object, ...)
## S3 method for class 'pid_summary'
print(x, ...)
## S3 method for class 'pid'
as.data.frame(x, ..., decode = TRUE)
## S3 method for class 'pid'
as.list(x, ..., decode = TRUE)
## S4 method for signature 'pid'
show(object)
## S4 method for signature 'pid'
```

pid-class

```
rep(x, ...)
## S4 method for signature 'pid'
x[i, j, ..., drop = TRUE]
## S4 method for signature 'pid'
x[[i, j, ..., exact = TRUE]]
## S4 method for signature 'pid'
c(x, ...)
```

Arguments

Х	Х
•••	
object	object
decode	If TRUE, data is decoded
i	i
j	j
drop	drop
exact	exact

Slots

sn Unique record identifier.

.Data Unique group identifier.

link_id Unique reference ID for each match.

pid_cri Match stage of the step-wise linkage.

pid_dataset Data sources in each group.

pid_total The number of records in each group.

iteration The iteration when a record was matched to it's group (.Data).

```
# A test for pid objects
pd <- links(criteria = 1)
is.pid(pd); is.pid(2)</pre>
```

predefined_tests Predefined logical tests in diyar

Description

A collection of predefined logical tests used with sub_criteria objects

Usage

```
exact_match(x, y)
range_match(x, y, range = 10)
prob_link(
    x,
    y,
    cmp_func,
    attr_threshold,
    probabilistic,
    return_weights = FALSE
)
true(x, y)
```

Arguments

false(x, y)

x	Attribute(s) to be compared against.
У	Attribute(s) to be compared by.
range	Difference between y and x.
cmp_func	Logical tests such as string comparators. See links_wf_probabilistic.
attr_threshold	Matching set of weight thresholds for each result of cmp_func. See links_wf_probabilistic.
score_threshold	
	Score threshold determining matched or linked records. See links_wf_probabilistic.
probabilistic	If TRUE, matches determined through a score derived base on Fellegi-Sunter model for probabilistic linkage. See links_wf_probabilistic.
return_weights	If TRUE, returns the match-weights and score-thresholds for record pairs.

Details

exact_match() - test that x == yrange_match() - test that $x \le y \le (x + range)$

reframe

prob_link() - Test that a record-pair relate to the same entity based on Fellegi and Sunter (1969) model for deciding if two records belong to the same entity.

In summary, record-pairs are created and categorised as matches and non-matches (attr_threshold) with user-defined functions (cmp_func). If probabilistic is TRUE, two probabilities (m and u) are used to calculate weights for matches and non-matches. The m-probability is the probability that matched records are actually from the same entity i.e. a true match, while u-probability is the probability that matched records are not from the same entity i.e. a false match. Record-pairs whose total score are above a certain threshold (score_threshold) are assumed to belong to the same entity.

Agreement (match) and disagreement (non-match) scores are calculated as described by Asher et al. (2020).

For each record pair, an agreement for attribute i is calculated as;

```
\log_2(m_i/u_i)
```

For each record pair, a disagreement score for attribute *i* is calculated as;

$$\log_2((1-m_i)/(1-u_i))$$

where m_i and u_i are the m and u-probabilities for each value of attribute *i*.

Note that each probability is calculated as a combined probability for the record pair. For example, if the values of the record-pair have u-probabilities of 0.1 and 0.2 respectively, then the u-probability for the pair will be 0.02.

Missing data (NA) are considered non-matches and assigned a u-probability of 0.

Examples

```
`exact_match`
exact_match(x = 1, y = 1)
exact_match(x = 1, y = 2)
`range_match`
range_match(x = 10, y = 16, range = 6)
range_match(x = 16, y = 10, range = 6)
```

reframe

Description

Modify the attributes of a sub_criteria object.

schema

Usage

```
reframe(x, ...)
```

S3 method for class 'sub_criteria'
reframe(x, func = identity, ...)

Arguments

Х	[sub_criteria].
	Arguments passed to methods.
func	[function]. Transformation function.

See Also

sub_criteria; eval_sub_criteria; attr_eval

Examples

```
s_cri <- sub_criteria(month.abb, month.name)
reframe(s_cri, func = function(x) x[12])
reframe(s_cri, func = function(x) x[12:1])
reframe(s_cri, func = function(x) attrs(x[1:6], x[7:12]))</pre>
```

schema

Schema diagram for group identifiers

Description

Create schema diagrams for number_line, epid, pid and pane objects.

Usage

```
schema(x, ...)
## S3 method for class 'number_line'
schema(x, show_labels = c("date", "case_overlap_methods"), ...)
## S3 method for class 'epid'
schema(
    x,
    title = NULL,
    show_labels = c("length_arrow"),
    show_skipped = TRUE,
    show_non_finite = FALSE,
    theme = "dark",
    seed = NULL,
    custom_label = NULL,
```

schema

```
• • •
)
## S3 method for class 'pane'
schema(
 х,
  title = NULL,
  show_labels = c("window_label"),
  theme = "dark",
  seed = NULL,
  custom_label = NULL,
  . . .
)
## S3 method for class 'pid'
schema(
 х,
  title = NULL,
  show_labels = TRUE,
  theme = "dark",
  orientation = "by_pid",
  seed = NULL,
 custom_label = NULL,
  . . .
)
```

Arguments

х	[number_line epid pid pane]
	Other arguments.
show_labels	[logical character]. Show/hide certain parts of the schema. See Details.
title	[character]. Plot title.
show_skipped	[logical]. Show/hide "Skipped" records.
show_non_finit	e
	[logical]. Show/hide records with non-finite date values.
theme	[character]. Options are "dark" or "light".
seed	[integer]. See set.seed. Used to get a consistent arrangement of items in the plot.
custom_label	[character]. Custom label for each record of the identifier.
orientation	[character]. Show each record of a pid object within its group id ("by_pid") or its pid_cri ("by_pid_cri")

Details

A visual aid to describe the data linkage (links), episode tracking (episodes) or partitioning process (partitions).

show_labels options (multi-select)

- schema.epid **TRUE**, **FALSE**, "sn", "epid", "date", "case_nm", "wind_nm", "length", "length_arrow", "case_overlap_methods" or "recurrence_overlap_methods"
- schema.pane TRUE, FALSE, "sn", "pane", "date", "case_nm" or "window_label"
- schema.pid TRUE, FALSE, "sn" or "pid"

Value

ggplot objects

Examples

```
schema(number_line(c(1, 2), c(2, 1)))
schema(episodes(1:10, 2))
schema(partitions(1:10, by = 2, separate = TRUE))
schema(links(list(c(1, 1, NA, NA), c(NA, 1, 1, NA))))
```

set_operations Set operations on number line objects

Description

Perform set operations on a pair of [number_line]s.

Usage

```
union_number_lines(x, y)
```

intersect_number_lines(x, y)

subtract_number_lines(x, y)

Arguments

х	[number_line]
У	[number_line]

Details

union_number_lines() - Combined the range of x and that of y
intersect_number_line() - Subset of x that overlaps with y and vice versa
subtract_number_lines() - Subset of x that does not overlap with y and vice versa.
The direction of the returned [number_line] will be that of the widest one (x or y). If x and y
have the same length, it'll be an "increasing" direction.

If x and y do not overlap, NA ("NA ?? NA") is returned.

staff_records

Value

[number_line]; list

See Also

number_line; overlaps

Examples

staff_records Datasets in diyar package

Description

Datasets in diyar package

Usage

```
data(staff_records)
```

```
data(missing_staff_id)
```

data(infections)

data(infections_2)

data(infections_3)

```
data(infections_4)
```

data(hospital_admissions)

data(patient_list)

data(patient_list_2)

data(hourly_data)

data(Opes)

data(episode_unit)

data(overlap_methods)

data(patient_records)

Format

data.frame data.frame data.frame data.frame data.frame data.frame data.frame data.frame An object of class data.frame with 5 rows and 4 columns. data.frame list list data.frame

Details

staff_records - Staff record with some missing data
missing_staff_id - Staff records with missing staff identifiers
infections, infections_2, infections_3 and infections_4 - Reports of bacterial infections
hospital_admissions - Hospital admissions and discharges
patient_list & patient_list_2 - Patient list with some missing data
Hourly data

sub_criteria

Opes - List of individuals with the same name

Duration in seconds for each 'episode_unit'

Permutations of number_line overlap methods

Examples

```
data(staff_records)
data(missing_staff_id)
data(infections)
data(infections_2)
data(infections_3)
data(infections_4)
data(hospital_admissions)
data(patient_list)
data(patient_list_2)
data(hourly_data)
data(Opes)
data(episode_unit)
data(overlap_methods)
data(patient_records)
```

sub_criteria Match criteria

Description

Match criteria for record linkage with links and episodes

Usage

```
sub_criteria(
    ...,
    match_funcs = c(exact = diyar::exact_match),
    equal_funcs = c(exact = diyar::exact_match),
    operator = "or"
)
attrs(..., .obj = NULL)
eval_sub_criteria(x, ...)
## S3 method for class 'sub_criteria'
print(x, ...)
## S3 method for class 'sub_criteria'
format(x, show_levels = FALSE, ...)
## S3 method for class 'sub_criteria'
```

```
eval_sub_criteria(
    x,
    x_pos = seq_len(max(attr_eval(x))),
    y_pos = rep(1L, length(x_pos)),
    check_duplicates = TRUE,
    depth = 0,
    ...
)
```

Arguments

	[atomic] Attributes passed to or eval_sub_criteria() or eval_sub_criteria()
	Arguments passed to methods for eval_sub_criteria()
match_funcs	[function]. User defined logical test for matches.
equal_funcs	[function]. User defined logical test for identical record sets (all attributes of the same record).
operator	[character]. Options are "and" or "or".
.obj	[data.frame list]. Attributes.
x	[sub_criteria]. Attributes.
show_levels	[logical]. If TRUE, show recursive depth for each logic statement of the match criteria.
x_pos	[integer]. Index of one half of a record pair.
y_pos	[integer]. Index of one half of a record pair.
check_duplicates	
	[logical]. If FALSE, does not check duplicate values. The result of the initial check will be recycled.
depth	[integer]. First order of recursion.

Details

sub_criteria() - Create a match criteria as a sub_criteria object. A sub_criteria object contains attributes to be compared, logical tests for the comparisons (see predefined_tests for examples) and another set of logical tests to determine identical records.

attrs() - Create a d_attribute object - a collection of atomic objects that can be passed to sub_criteria() as a single attribute.

eval_sub_criteria() - Evaluates a sub_criteria object.

At each iteration of links or episodes, record-pairs are created from each attribute of a sub_criteria object. eval_sub_criteria() evaluates each record-pair using the match_funcs and equal_funcs functions of a sub_criteria object. See predefined_tests for examples of match_funcs and equal_funcs.

User-defined functions are also permitted as match_funcs and equal_funcs. Such functions must meet three requirements:

1. It must be able to compare the attributes.

sub_criteria

- 2. It must have two arguments named `x` and `y`, where `y` is the value for one observation being compared against all other observations (`x`).
- 3. It must return a logical object i.e. TRUE or FALSE.

attrs() is useful when the match criteria requires an interaction between the multiple attributes. For example, attribute 1 +attribute 2 >attribute 3.

Every attribute, including those in attrs(), must have the same length or a length of 1.

Value

sub_criteria

See Also

predefined_tests; links; episodes; eval_sub_criteria

```
# Attributes
attr_1 <- c(30, 28, 40, 25, 25, 29, 27)
attr_2 <- c("M", "F", "U", "M", "F", "U", "M")
# A match criteria
## Example 1 - A maximum difference of 10 in attribute 1
s_cri1 <- sub_criteria(attr_1, match_funcs = range_match)</pre>
s_cri1
# Evaluate the match criteria
## Compare the first element of 'attr_1' against all other elements
eval_sub_criteria(s_cri1)
## Compare the second element of 'attr_1' against all other elements
x_pos_val <- seq_len(max(attr_eval(s_cri1)))</pre>
eval_sub_criteria(s_cri1,
                  x_{pos} = x_{pos}val,
                  y_pos = rep(2, length(x_pos_val)))
## Example 2 - `s_cri1` AND an exact match on attribute 2
s_cri2 <- sub_criteria(</pre>
  s_cri1,
  sub_criteria(attr_2, match_funcs = exact_match),
  operator = "and")
s_cri2
## Example 3 - `s_cri1` OR an exact match on attribute 2
s_cri3 <- sub_criteria(</pre>
  s_cri1,
  sub_criteria(attr_2, match_funcs = exact_match),
  operator = "or")
s_cri3
# Evaluate the match criteria
eval_sub_criteria(s_cri2)
```

windows

windows

Windows and lengths

Description

Covert windows to and from case_lengths and recurrence_lengths.

Usage

```
epid_windows(date, lengths, episode_unit = "days")
epid_lengths(date, windows, episode_unit = "days")
index_window(date, from_last = FALSE)
```

Arguments

date	As used in episodes.
lengths	The duration (lengths) between a date and window.
episode_unit	Time unit of lengths. Options are "seconds", "minutes", "hours", "days", "weeks", "months" or "years". See diyar::episode_unit
windows	The range (windows) relative to a date for a given duration (length).
from_last	As used in episodes.

Details

epid_windows - returns the corresponding window for a given a date, and case_length or recurrence_length. epid_lengths - returns the corresponding case_length or recurrence_length for a given date and window.

index_window - returns the corresponding case_length or recurrence_length for the date only. index_window(date = x) is a convenience function for epid_lengths(date = x, window = x).

windows

Value

number_line.

```
# Which `window` will a given `length` cover?
date <- Sys.Date()
epid_windows(date, 10)
epid_windows(date, number_line(5, 10))
epid_windows(date, number_line(-5, 10))
epid_windows(date, -5)
```

```
# Which `length` is required to cover a given `window`?
date <- number_line(Sys.Date(), Sys.Date() + 20)
epid_lengths(date, Sys.Date() + 30)
epid_lengths(date, number_line(Sys.Date() + 25, Sys.Date() + 30))
epid_lengths(date, number_line(Sys.Date() - 10, Sys.Date() + 30))
epid_lengths(date, Sys.Date() - 10)
# Which `length` is required to cover the `date`?
```

```
# Which length is required to cover the date ?
index_window(20)
index_window(number_line(15, 20))
```
